FUNCTION: Non-fluorescent pigment
BIOPHYSICOCHEMICAL PROPERTIES:
PTM: Contains a chromophore consisting of modified amino acid residues. The chromophore is formed by autocatalytic backbone condensation between xaa-N and Gly-(N+2), oxidation of Tyr-(N+1) to didehydrotyrosine, and formation of a double bond to the all amino nitrogen of residue xaa-N. Maturation of the chromophore requires nothing other than molecular oxygen. The precise
                                                                                                                                                           SUBUNIT: Homotetramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    _TaxID=75301;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TaxID=45264;

           PTM: Contains a chromophore consisting of modified amino residues. The chromophore is formed by autocatalytic back condensation between Xaa-N and Gly-(N+2), oxidation of Ty to didahydrotyrosine, and formation of a double bond to t amino nitrogen of residue Xaa-N. Maturation of the chromo requires nothing other than molecular oxygen. BIOTECHNOLOGY: Fluorescent proteins have become a useful ubiquitous tool for making chimeric proteins, where they as a fluorescent protein tag. Typically they tolerate N-

They enable wide range of applications where they have functioned as a cell lineage tracer, reporter of gene expression, or as a measure o protein-protein interactions.

MISCELLANEOUS: The wild-type form is non-fluorescent with the color being pH dependent, ranging from yellow at low pH, through the color being pH dependent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SIMILARITY:

Q9U6Y7;
                                             -I- PTM: Contains a chromophore is formed by autocatalytic backbone residues. The chromophore is formed by autocatalytic backbone condensation between Xaa-N and Gly-(N+2), oxidation of Tyr (N+1) to didehydrotyrosine, and formation of a double bond to the alphanamino nitrogen of residue Xaa-N. Maturation of the chromophore requires nothing other than molecular oxygen. The precise stereochemistry of the tyrosine has not been determined.

-I- BIOTECHNOLOGY: Fluorescent proteins have become a useful and ubiquitous tool for making chimeric proteins, where they function as a fluorescent protein tag. Typically they tolerate N- and C-terminal fusion to a broad variety of proteins. They have been expressed in most known cell types and are used as a noninvasive fluorescent marker in living cells and organisms. They enable a wide range of applications where they have been expression, protein interactions.

-I- SIMILARITY: Belongs to the GFP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-FEB-2005 (Rel. 46, Created)

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Sequence 12, Application US/10885988

Publication No. US20040259165A1

GENERAL INFORMATION:

APPLICANT: REGENTS OF THE UNIVERSITY OF CALIFORNIA

APPLICANT: TSIEN, ROGET

APPLICANT: Campbell, Robert

TITLE OF INVENTION: NON-OLIGOMERIZING FLUCRESCENT PROTEINS

FILE REFERENCE: REGEN1530-2

CURRENT APPLICATION NUMBER: US/10/885,988

CURRENT FILING DATE: 2001-07-06

PRIOR APPLICATION NUMBER: US/09/866,538

PRIOR APPLICATION NUMBER: US/09/866,538

PRIOR FILING DATE: 2001-05-24

NUMBER OF SEQ ID NOS: 29

SOFTWARE: Patentin version 3.0
